

Stainless Steel Press Fittings for Reliable Fluid Handling

TruPress stainless steel* piping systems offer a modern and dependable connection solution, designed for compatibility with a wide range of industrial piping applications.

Why Trust TruPress?

TruPress systems are built around three core advantages:

- **Simplicity** – Just cut, insert, and press. No flame, no license required.
- **Speed** – Installation time reduced by up to 60% compared to traditional methods.
- **Security** – No open flame, no fire risk, and a cleaner work environment—even in tight spaces.

Proven Press Connection Technology

The TruPress connection is achieved by inserting the pipe into the fitting up to the marked depth, then pressing with an approved tool. During pressing, the fitting deforms in two planes:

- One plane creates a permanent mechanical bond, ensuring long-term strength.
- The second deforms the seal ring, whose elastic properties maintain a permanently tight joint.

Engineered for Safety and Performance

All fittings are supplied with high-quality black EPDM seal rings as standard, making them ideal for potable water applications and ensuring a secure, leak-free connection.

****TruPress is also available in copper, copper-nickel, and galvanized carbon steel***
